

Time Machine Framework for JBoss

TIME TRAVEL YOUR JAVA APPLICATIONS

Features

Time Travel your Java Applications Deployed to JBoss AS or WildFly

Automate Date and Time Sensitive Testing by Defining Simple Rules

Intuitive and Easy to Use GUI

Supported on the Following

- Linux
- Windows
- Solaris
- AIX
- HPUX

Introducing the Time Machine Framework for JBoss

The Time Machine Framework for JBoss provides a great set of features enabling time shift testing scenarios for Java applications deployed to the JBoss AS or WildFly Java application server.

This Framework enables customers to use Time Machine functionality to time shift test Java applications within a JBoss managed server without the need to create a separate instance of the application server for testing other time related activities. The Framework allows customers to configure and automatically create different virtual clocks on managed servers within the JBoss server as well as the granularity to establish virtual clock rules for specific applications deployed to the managed server.

The Time Machine Framework for JBoss is controlled using the Time Machine Management Console, a Java application that provides an intuitive graphical interface for Time Machine and the Time Machine Suite of Products. With the Management Console, users can see the managed servers that are configured in JBoss, what applications are deployed and easily establish real-time virtual clocks or rules that determine exactly when a virtual clock will be created.
